Sparse word representations

Prof Dr Marko Robnik-Šikonja Natural language processing, Edition 2022

Contents

- embeddings
- bag-of-words
- document similarity
- tf-idf weighting
- PPMI weighting
- use in document retrieval
- document retrieval evaluation

Distributional semantics

You shall know a word by the company it keeps

Firth, J. R. (1957). A synopsis of linguistic theory 1930–1955. In Studies in Linguistic Analysis, p. 11. Blackwell, Oxford.

"The meaning of a word is its use in the language"
Ludwig Wittgenstein, PI #43

Distributional semantics

- a baseline for a distributional word similarity
- first-order co-occurrence of words (syntagmatic association), words that are typically nearby each other: wrote, book, or poem
- second-order co-occurrence (paradigmatic association), words with similar neighbors: wrote, said, or remarked

We define a word as a vector

- Called an "embedding" because it's embedded into a space
- The standard way to represent meaning in NLP
- Fine-grained model of meaning for similarity
 - NLP tasks like sentiment analysis
 - With words, requires same word to be in training and test
 - With embeddings: ok if similar words occurred!!!
 - Question answering, conversational agents, etc

Two kinds of embeddings

- sparse, e.g., tf-idf
 - A common baseline model
 - Sparse vectors
 - Words are represented by a simple function of the counts of nearby words
- dense, e.g., word2vec
 - Dense vectors
 - Representation is created by training a classifier to distinguish nearby and faraway words

Word embeddings

 embeddings shall transform syntactic and semantic similarity of words into vector space (as distances and directions)

Sparse vector representation

 An elephant is a mammal. Mammals are animals. Humans are mammals, too. Elephants and humans live in Africa.

Africa	animal	be	elephant	human	in	live	mammal	too
1	1	3	2	2	1	1	3	1

9 dimensional vector (1,1,3,2,2,1,1,3,1)

In reality this is sparse vector of dimension |V| (vocabulary size in order of 10,000 dimensions)

Similarity between documents and queries in vector space.

Vectors and documents

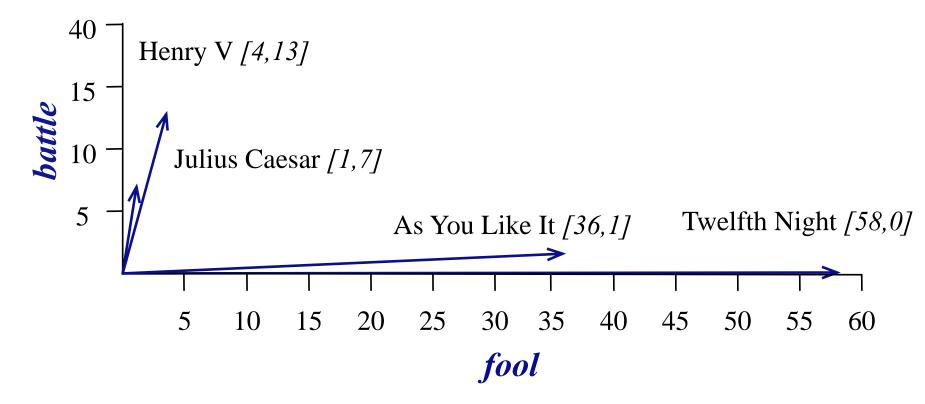

- a word occurs in several documents
- a document contains several words
- both words and documents are vectors
- an example: Shakespeare

	As You Like It	Twelfth Night	Julius Caesar	Henry V
battle		0	7	13
good	l 14	80	62	89
fool	36	58	1	4
wit	20	15	2	3

- term-document matrix, dimension |V| x |D|
- a sparse matrix

Visualizing document vectors

• e.g., in two dimensional space

• the difference between dramas and comedies

Vectors are the basis of information retrieval

	As You Like It	Twelfth Night	Julius Caesar	Henry V
battle		0	7	13
good	114	80	62	89
fool	36	58	1	4
wit	20	15	2	3

- Vectors are similar for the two comedies
- Different than the history
- Comedies have more fools and wit and fewer battles.

Words can be vectors too

	As You Like It	Twelfth Night	Julius Caesar	Henry V
battle	1	0	7	13
good	114	80	62	89
fool	36	58	1	4
wit	20	15	2	3

battle is "the kind of word that occurs in Julius Caesar and Henry V"

fool is "the kind of word that occurs in comedies, especially Twelfth Night"

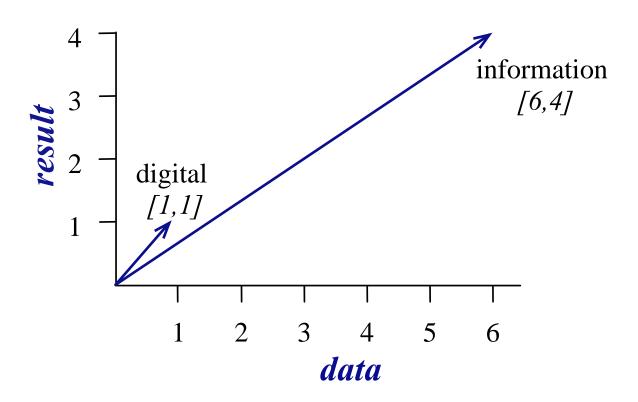

More common: word-word matrix (or "term-context matrix")

• Two words are similar in meaning if their context vectors are similar

sugar, a sliced lemon, a tablespoonful of **apricot** their enjoyment. Cautiously she sampled her first **pineapple** well suited to programming on the digital **computer**.

jam, a pinch each of, and another fruit whose taste she likened In finding the optimal R-stage policy from for the purpose of gathering data and **information** necessary for the study authorized in the

	aardvark	computer	data	pinch	result	sugar	•••
apricot	0	0	0	1	0	1	
pineapple	0	0	0	1	0	1	
digital	0	2	1	0	1	0	
information	0	1	6	0	4	0	

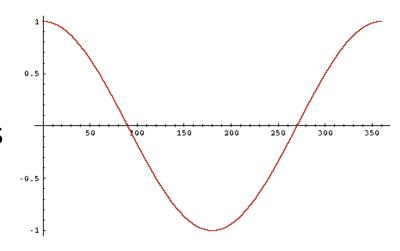

Reminders from linear algebra

dot-product
$$(\vec{v}, \vec{w}) = \vec{v} \cdot \vec{w} = \sum_{i=1}^{N} v_i w_i = v_1 w_1 + v_2 w_2 + \dots + v_N w_N$$

vector length
$$|\vec{v}| = \sqrt{\sum_{i=1}^{N} v_i^2}$$

Cosine as a similarity metric

- -1: vectors point in opposite directions
- +1: vectors point in same directions
- 0: vectors are orthogonal

 Frequency is non-negative, so cosine range 0-1

Document similarity

- Assume orthogonal dimensions
- Cosine similarity
- Dot (scalar) product of vectors

$$\cos(\Theta) = \frac{A \cdot B}{|A||B|}$$

But raw frequency is a bad representation

- Frequency is clearly useful; if *sugar* appears a lot near *apricot*, that's useful information.
- But overly frequent words like the, it, or they are not very informative about the context
- Need a function that resolves this frequency paradox!

tf-idf: combine two factors

• tf: term frequency. frequency count (usually log-transformed):

$$tf_{t,d} = \begin{cases} 1 + \log_{10} count(t,d) & \text{if } count(t,d) > 0 \\ 0 & \text{otherwise} \end{cases}$$

• Idf: inverse document frequency: tf-

$$\mathrm{idf}_i = \log\left(\frac{N}{\mathrm{df}_i}\right)$$

Words like "the" or "good" have very low idf

of docs that have word i

tf-idf value for word t in document d:

$$w_{t,d} = \mathrm{tf}_{t,d} \times \mathrm{idf}_t$$

tf-idf similarity

- Compare two words using tf-idf cosine to see if they are similar
- Compare two documents
 - Take the centroid of vectors of all the words in the document
 - Centroid document vector is:

$$d = \frac{w_1 + w_2 + \dots + w_k}{k}$$

Weighted similarity

Between query and document

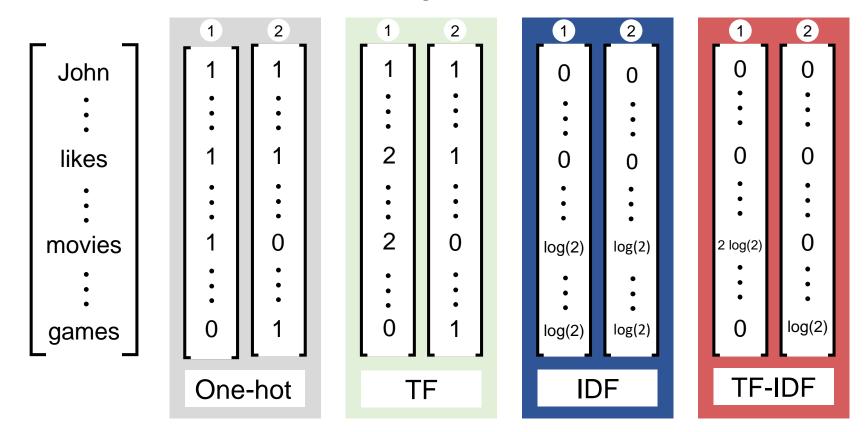

$$sim(q,d) = \frac{\sum_{b} w_{b,d} \cdot w_{b,q}}{\sqrt{\sum_{b} w_{b,d}^{2}} \cdot \sqrt{\sum_{b} w_{b,q}^{2}}}$$

Ranking by the decreasing similarity

Weights in text representations

Sentences

- 1."John likes to watch movies. Mary likes movies too."
- 2."John also likes to watch football games."

An alternative to tf-idf

- Ask whether a context word is **particularly informative** about the target word.
- Positive Pointwise Mutual Information (PPMI)

Pointwise Mutual Information

Pointwise mutual information:

Do events x and y co-occur more than if they were independent?

$$PMI(X, Y) = \log_2 \frac{P(x, y)}{P(x)P(y)}$$

PMI between two words: (Church & Hanks 1989)

Do words x and y co-occur more than if they were independent?

$$PMI(word_1, word_2) = \log_2 \frac{P(word_1, word_2)}{P(word_1)P(word_2)}$$

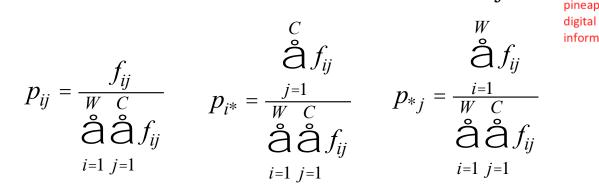

Positive Pointwise Mutual Information

- PMI ranges from $-\infty$ to $+\infty$
- But the negative values are problematic
 - Things are co-occurring less than we expect by chance
 - Unreliable without enormous corpora
 - Imagine w₁ and w₂ whose probability is each 10⁻⁶
 - Hard to be sure $p(w_1, w_2)$ is significantly different than 10^{-12}
 - Plus it's not clear people are good at "unrelatedness"
- So we just replace negative PMI values by 0
- Positive PMI (PPMI) between word1 and word2:

$$PPMI(word_1, word_2) = \max \left(\log_2 \frac{P(word_1, word_2)}{P(word_1)P(word_2)}, 0 \right)$$

Computing PPMI on a term-context matrix

- Matrix F with W rows (words) and C columns (contexts)
- \boldsymbol{f}_{ij} is # of times \boldsymbol{w}_i occurs in context \boldsymbol{c}_j

	aardvark	computer	data	pinch	result	sugar
pricot	0	0	0	1	0	1
ineapple	0	0	0	1	0	1
igital	0	2	1	0	1	0
formation	0	1	6	0	4	0

$$pmi_{ij} = \log_2 \frac{p_{ij}}{p_{i*}p_{*j}} \qquad ppmi_{ij} = \begin{cases} pmi_{ij} & \text{if } pmi_{ij} > 0 \\ 0 & \text{otherwise} \end{cases}$$

Weighting PMI

- PMI is biased toward infrequent events
 - Very rare words have very high PMI values
- Two solutions:
 - Give rare words slightly higher probabilities
 - Use add-one smoothing (which has a similar effect)

Weighting PMI: Giving rare context words slightly higher probability

• Raise the context probabilities to $\alpha = 0.75$:

$$PPMI_{\alpha}(w,c) = \max(\log_2 \frac{P(w,c)}{P(w)P_{\alpha}(c)}, 0)$$

$$P_{\alpha}(c) = \frac{count(c)^{\alpha}}{\sum_{c} count(c)^{\alpha}}$$

- This helps because $P_{\alpha}(c) > P(c)$ for rare c
- Consider two events, P(a) = .99 and P(b)=.01

•
$$P_{\alpha}(a) = \frac{.99^{.75}}{.99^{.75} + .01^{.75}} = .97 \ P_{\alpha}(b) = \frac{.01^{.75}}{.01^{.75} + .01^{.75}} = .03$$

Use Laplace (add-1) smoothing

relative frequency based probability

$$P(w_i) = \frac{c_i}{N}$$

• Laplace smoothing (add-1)

$$P_{\text{Laplace}}(w_i) = \frac{c_i + 1}{N + V}$$

Add-k smoothing
 k=0.5, 0.1, 0.05, 0.01 ?

Add-2 Smoothed Count(w,context

	computer	data	pinch	result	sugar
apricot	2	2	3	2	3
pineapple	2	2	3	2	3
digital	4	3	2	3	2
information	3	8	2	6	2

	F	p(w)				
	computer	data	pinch	result	sugar	
apricot	0.03	0.03	0.05	0.03	0.05	0.20
pineapple	0.03	0.03	0.05	0.03	0.05	0.20
digital	0.07	0.05	0.03	0.05	0.03	0.24
information	0.05	0.14	0.03	0.10	0.03	0.36
p(context)	0.19	0.25	0.17	0.22	0.17	

Evaluation of document retrieval

 How to compare different text representations, weighting, algorithms, etc?

Performance measures for document retrieval

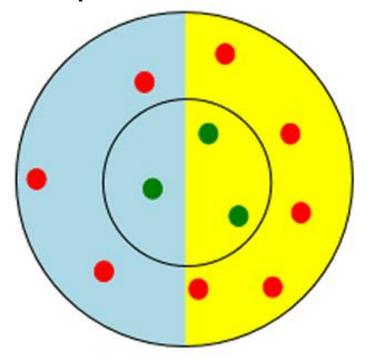

- Subjective measures
- Statistical measures
- Precision, recall
- A contingency table analysis of precision and recall

	Relevant	Non-relevant	
Retrieved	а	Ь	a + b = m
Not retrieved	С	d	c + d = N - m
	a + c = n	b + d = N - n	a + b + c + d = N

Precision and recall

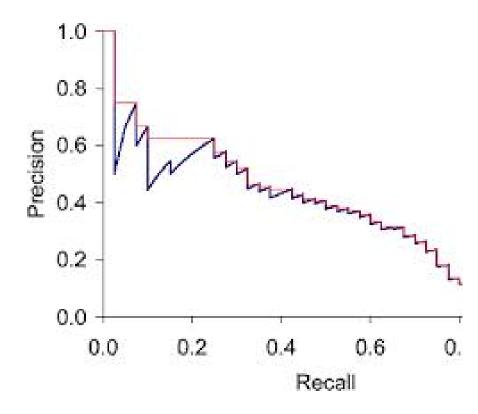

- N = number of documents in collection
- n = number of important documents for given query q
- *m* = number of retreived documents
- Search returns *m* documents including *a* relevant ones
- Precision P = a/m proportion of relevant document in the obtained ones
- recall R = a/n proportion of obtained relevant documents in all relevant documents

An example: low precision, low recall

- Returned Results
- Not Returned Results
- Relevant Results
- Irrelevant Results

Precision-recall graphs

F-measure

combine both P and R

$$F_{\beta} = \frac{(1+\beta^2) \cdot P \cdot R}{\beta^2 P + R} \text{ for } \beta > 0$$

$$F_{1} = \frac{2 \cdot P \cdot R}{P + R}$$

- Weighted precision and recall
- β =1 weighted harmonic mean
- Also used β =2 or β = 0.5

Precision@k

- for large number of returned document, the precision may no longer be a relevant measure (why)
- Precision@k is a precision achived for the first k returned documents

Document retrieval: Improvements to search

- Use dictionary, thesaurus, synonyms (e.g., Wordnet, learn from corpus)
- Query expansion with relevance information
 - User feedback
 - Personalization
 - Trusted document sources
- Semantic search

Web search problems

- No contents control
- Different quality of documents
- Up-to-date?
- (in)valid links
- Search engine manipulation

Specific improvements

- Specific types of queries require specific approaches
- Trustful sources -Wikipedia
- Hubs with relevant links (e.g., Yahoo)
- Graph theory and analysis, virtual communities,
- Additional information: titles, meta-information, URL
- Ranking of documents based on links
