

# A brief revision of neural networks

Prof Dr Marko Robnik-Šikonja

Natural Language Processing, Edition 2022

# Contents

- a gentle introduction to neural networks
- feed forward neural networks
- backpropagation
- convolutional neural networks
- attacks on neural networks

read Chapter 7 in Jurafsky & Martin, 3<sup>rd</sup> edition,

# Artificial neural networks (ANN)

- universal function Approximator
- intuition: neurons in successive layers encode useful features

# Artificial neural networks and brain analogy – a neuron

- more than a hundred types of neurons in brain

# Artificial neuron

The brain analogy is far from realistic: a neuron cell is highly complex, and so are interconnections.

# Perceptron

# Activation functions

- examples: step function, sigmoid (logistic)

# Activation functions

- ReLU (rectified linear unit)

$$f(x) = \max(0, x)$$

- softplus / approximation of ReLU with continuous derivation

$$f(x) = \ln(1+e^x)$$

- many others

# Learning: error backpropagation

- a single neuron is weak
- a network of neurons can approximate any continuous function
- deep neural network: more than one hidden level

- learning: error backpropagation

# Backpropagation learning algorithm for NN

- Backpropagation: A neural network learning algorithm
- Started by psychologists and neurobiologists to develop and test computational analogues of neurons
- A neural network: A set of connected input/output units where each connection has a weight associated with it
- During the learning phase, the network learns by adjusting the weights so as to be able to predict the correct class label of the input tuples
- Also referred to as connectionist learning due to the connections between units

# A multi-layer feed-forward NN

# How a multi-layer NN works?

- The **inputs** to the network correspond to the attributes measured for each training tuple
- Inputs are fed simultaneously into the units making up the **input layer**
- They are then weighted and fed simultaneously to a **hidden layer**
- The number of hidden layers is arbitrary; if more than 1 hidden layer is used, the network is called deep neural network
- The weighted outputs of the last hidden layer are input to units making up the **output layer**, which emits the network's prediction
- The network is **feed-forward**: None of the weights cycles back to an input unit or to an output unit of a previous layer
- If we have backwards connections the network is called recurrent neural network
- From a statistical point of view, networks perform **nonlinear regression**: Given enough hidden units and enough training samples, they can closely approximate any function

# Deep learning =

deep neural networks + large data sets +  
GPU

(+many new ideas)

Input

Hidden layer(s)

Output

# Why nonlinear activation function?

- The product of two linear transformations is itself a linear transformation.
- What is a derivative of a sigmoid?

# Feed-Forward Network

- Values are propagated from input through the network till the output layer which returns the prediction

# Feed-Forward Networks

# Feed-Forward Networks

# Feed-Forward Networks

# Feed-Forward Networks

# Feed-Forward Networks

# Softmax

- normalizes the output scores to be a probability distribution (values between 0 and 1, the sum is 1)

$$y_i = \frac{e^{z_i}}{\sum_{j \in \text{group}} e^{z_j}}$$

$$\frac{\partial y_i}{\partial z_i} = y_i (1 - y_i)$$

# Criterion function

- together with softmax we frequently use cross entropy as cost function  $C$

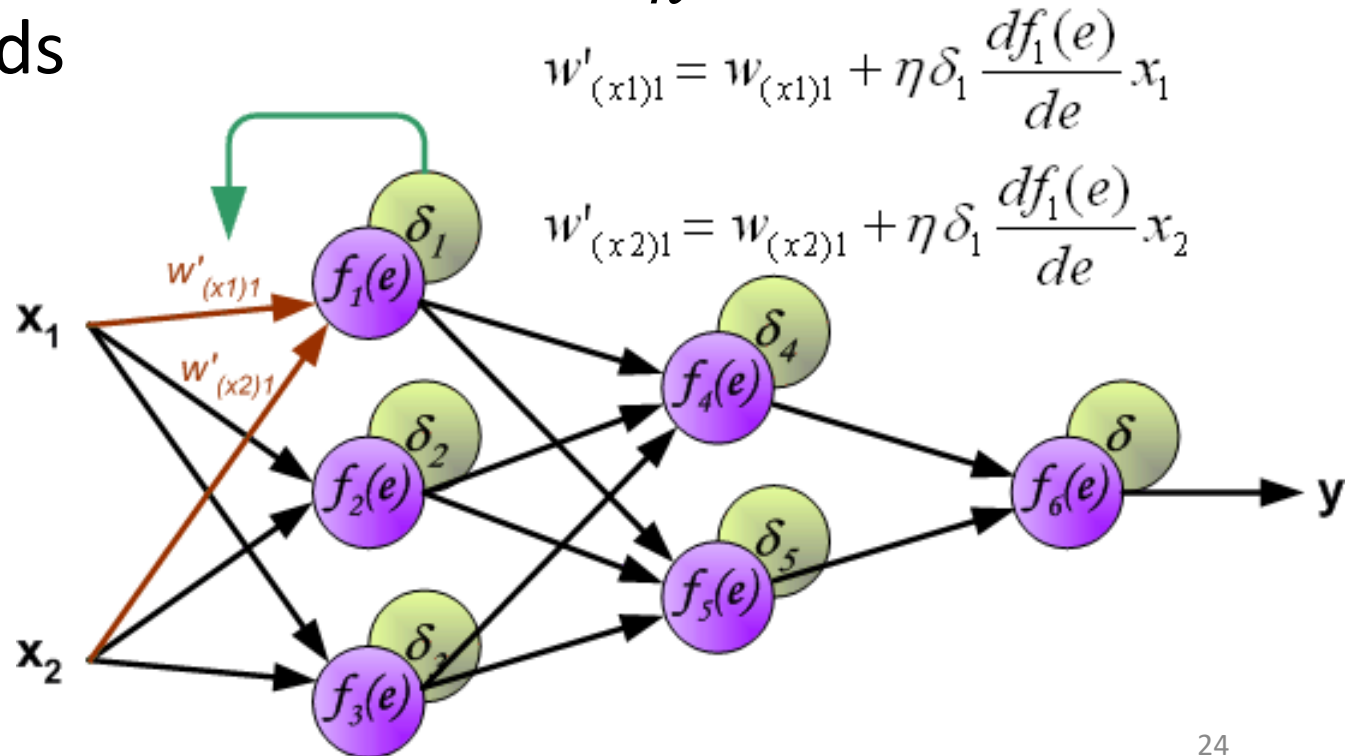

$$C = - \sum_j t_j \log y_j$$

 target value

$$\frac{\partial C}{\partial z_i} = \sum_j \frac{\partial C}{\partial y_j} \frac{\partial y_j}{\partial z_i} = y_i - t_i$$

# Learning with error backpropagation

- Backpropagation
- randomly initialize parameters (weights)
- compute error on the output
- compute contributions to error,  $\delta_n$ , on each step backwards
- gradient
- step
- iteratively
- batch
- minibatch

# Error Backpropagation

- We will do gradient descent on the whole network.
- Training will proceed from the last layer to the first.

# Error Backpropagation

- Introduce variables over the neural network

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

# Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

- Introduce variables over the neural network
  - Distinguish the input and output of each node

# Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

$$a_j = \sum_i w_{ij} z_i \quad a_k = \sum_j w_{jk} z_j \quad a_l = \sum_k w_{kl} z_k$$

$$z_j = g(a_j)$$

$$z_k = g(a_k)$$

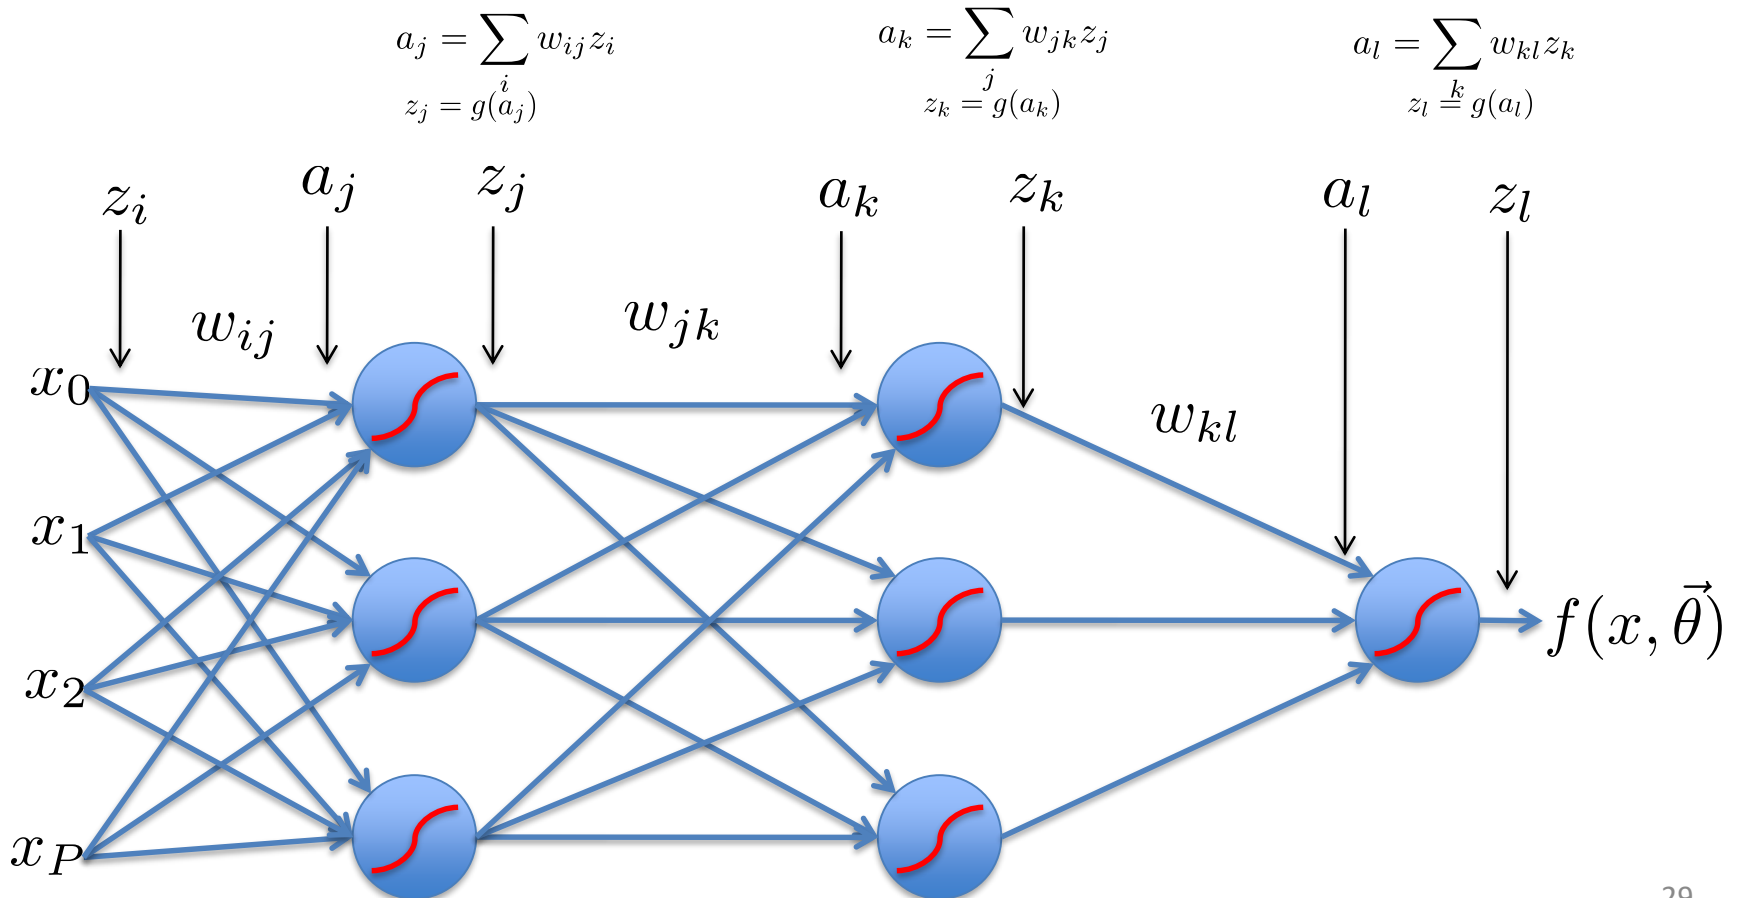

$$z_l = g(a_l)$$

# Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

Training: Take the gradient of the last component and iterate backwards

# Error Backpropagation

$$R(\theta) = \frac{1}{N} \sum_{n=0}^N L(y_n - f(x_n))$$

Empirical Risk Function

$$= \frac{1}{N} \sum_{n=0}^N \frac{1}{2} (y_n - f(x_n))^2$$

$$= \frac{1}{N} \sum_{n=0}^N \frac{1}{2} \left( y_n - g \left( \sum_k w_{kl} g \left( \sum_j w_{jk} g \left( \sum_i w_{ij} x_{n,i} \right) \right) \right) \right)^2$$

# Error Backpropagation

Optimize last layer weights  $w_{kl}$

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{l,n}} \right] \left[ \frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

# Error Backpropagation

Optimize last layer weights  $w_{kl}$

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{l,n}} \right] \left[ \frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[ \frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

# Error Backpropagation

Optimize last layer weights  $w_{kl}$

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{l,n}} \right] \left[ \frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[ \frac{\partial z_{k,n} w_{kl}}{\partial w_{kl}} \right]$$

# Error Backpropagation

$$a_l = \sum_k w_{kl} g(a_k)$$

# Error Backpropagation

Repeat for all previous layers

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{l,n}} \right] \left[ \frac{\partial a_{l,n}}{\partial w_{kl}} \right] = \frac{1}{N} \sum_n [-(y_n - z_{l,n})g'(a_{l,n})] z_{k,n} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{k,n}} \right] \left[ \frac{\partial a_{k,n}}{\partial w_{jk}} \right] = \frac{1}{N} \sum_n \left[ \sum_l \delta_{l,n} w_{kl} g'(a_{k,n}) \right] z_{j,n} = \frac{1}{N} \sum_n \delta_{k,n} z_{j,n}$$

$$\frac{\partial R}{\partial w_{ij}} = \frac{1}{N} \sum_n \left[ \frac{\partial L_n}{\partial a_{j,n}} \right] \left[ \frac{\partial a_{j,n}}{\partial w_{ij}} \right] = \frac{1}{N} \sum_n \left[ \sum_k \delta_{k,n} w_{jk} g'(a_{j,n}) \right] z_{i,n} = \frac{1}{N} \sum_n \delta_{j,n} z_{i,n}$$

# Error Back-propagation

- Error backpropagation unravels the multivariate chain rule and solves the gradient for each partial component separately.
- The target values for each layer come from the next layer.
- This feeds the errors back along the network.

# Backpropagation algorithm

- Iteratively process a set of training tuples & compare the network's prediction with the actual known target value
- For each training tuple, the weights are modified to **minimize the mean squared error** between the network's prediction and the actual target value
- Modifications are made in the “**backwards**” direction: from the output layer, through each hidden layer down to the first hidden layer, hence “**backpropagation**”
- Steps
  - Initialize weights to small random numbers, associated with biases
  - Propagate the inputs forward (by applying activation function)
  - Backpropagate the error (by updating weights and biases)
  - Terminating condition (when error is very small, etc.)

# Defining a network topology

- Decide the network topology: Specify # of units in the *input layer*, # of *hidden layers* (if  $> 1$ ), # of units in *each hidden layer*, and # of units in the *output layer*
- Normalize the input values for each attribute measured in the training tuples to [0.0—1.0]
- One input unit per domain value, each initialized to 0
- Output, if for classification and more than two classes, one output unit per class is used
- Once a network has been trained and its accuracy is unacceptable, repeat the training process with a *different network topology* or a *different set of initial weights*

# Neural network as a classifier

- Weakness
  - Long training time
  - Require a number of parameters typically best determined empirically, e.g., the network topology or “structure.”
  - Poor interpretability: difficult to interpret the symbolic meaning behind the learned weights and of “hidden units” in the network
- Strength
  - High tolerance to noisy data
  - Ability to classify untrained patterns
  - Well-suited for continuous-valued inputs *and outputs*
  - Successful on an array of real-world data, e.g., hand-written letters
  - Algorithms are inherently parallel
  - Techniques exist for the extraction of explanations from trained neural networks

# Efficiency and interpretability

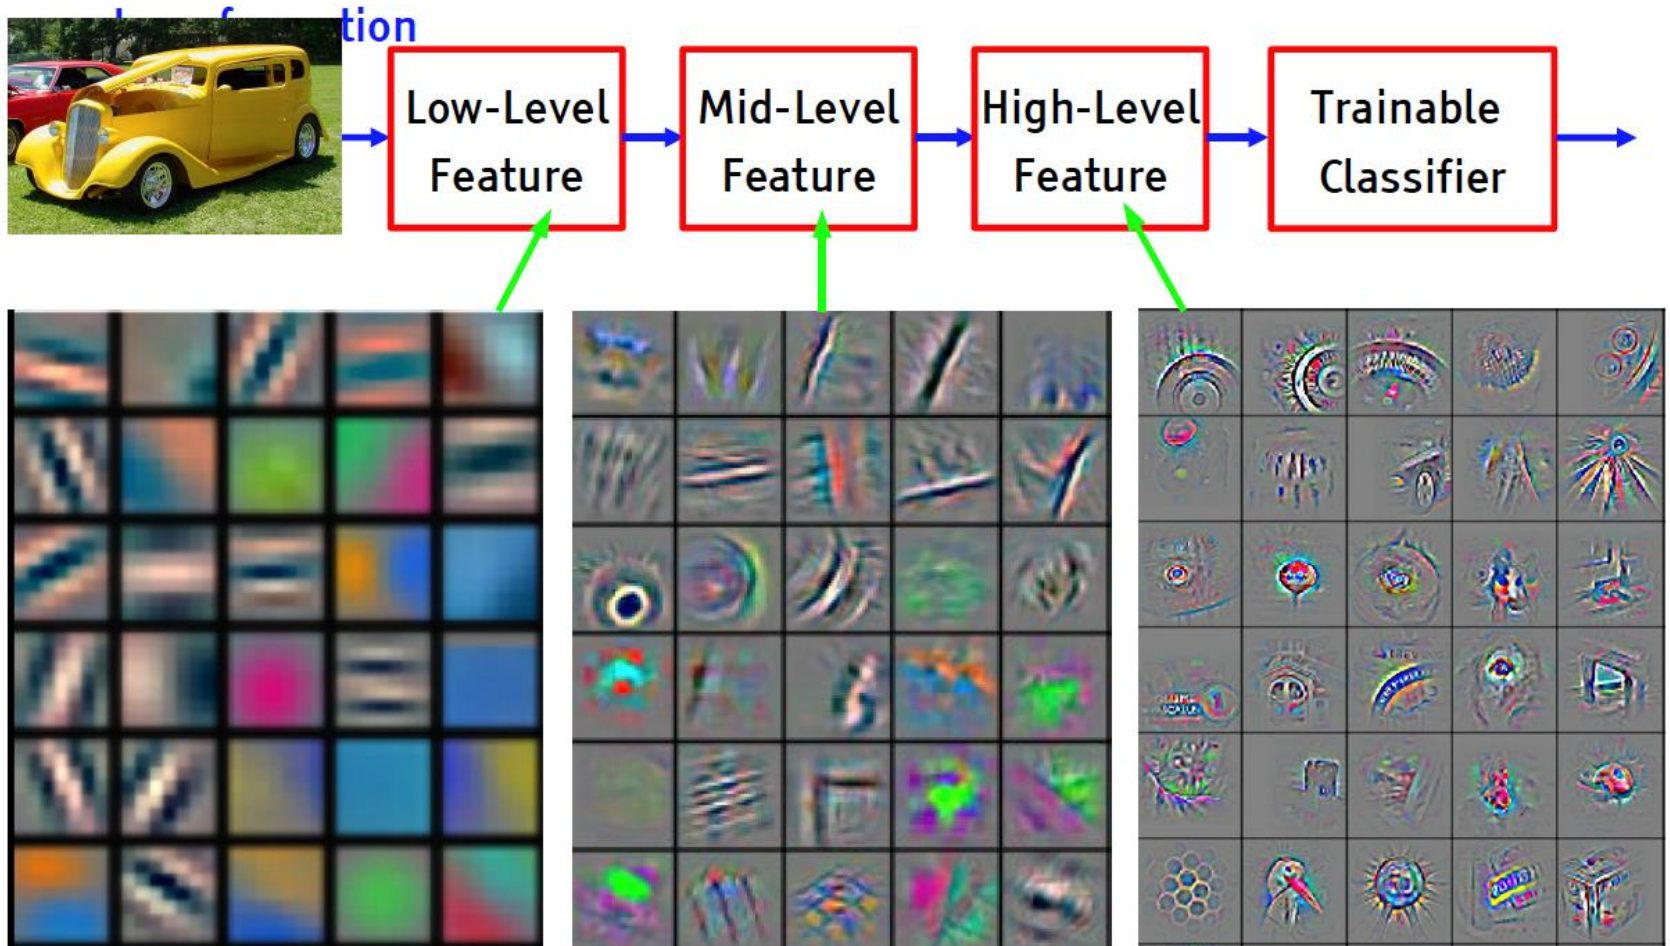

- Efficiency of backpropagation: Each epoch (one iteration through the training set) takes  $O(|D| * w)$ , with  $|D|$  tuples and  $w$  weights, but # of epochs can be exponential to  $n$ , the number of inputs, in worst case
- For easier comprehension: Rule extraction by network pruning
  - Simplify the network structure by removing weighted links that have the least effect on the trained network
  - Then perform link, unit, or activation value clustering
  - The set of input and activation values are studied to derive rules describing the relationship between the input and hidden unit layers
- Sensitivity analysis: assess the impact that a given input variable has on a network output. The knowledge gained from this analysis can be represented in rules

# Interpretation of hidden layers

- What are the hidden layers doing?!
- Feature Extraction
- The non-linearities in the feature extraction can make interpretation of the hidden layers very difficult.
- This leads to Neural Networks being treated as **black boxes**.

# Deep learning = learning of hierarchical representation

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

# Overfitting and model complexity

- which curve is more plausible given the data?
- overfitting
- neural nets are especially prone to overfitting
- why?

# Approaches to prevent overfitting

- Weight-decay
- Weight-sharing
- Early stopping
- Model averaging
- Bayesian fitting of neural nets
- Dropout
- Generative pre-training
- etc.

# Deep learning successes

ILSVRC top-5 error rate on ImageNet

Microsoft claims new speech recognition record, achieving a super-human 5.1% error rate

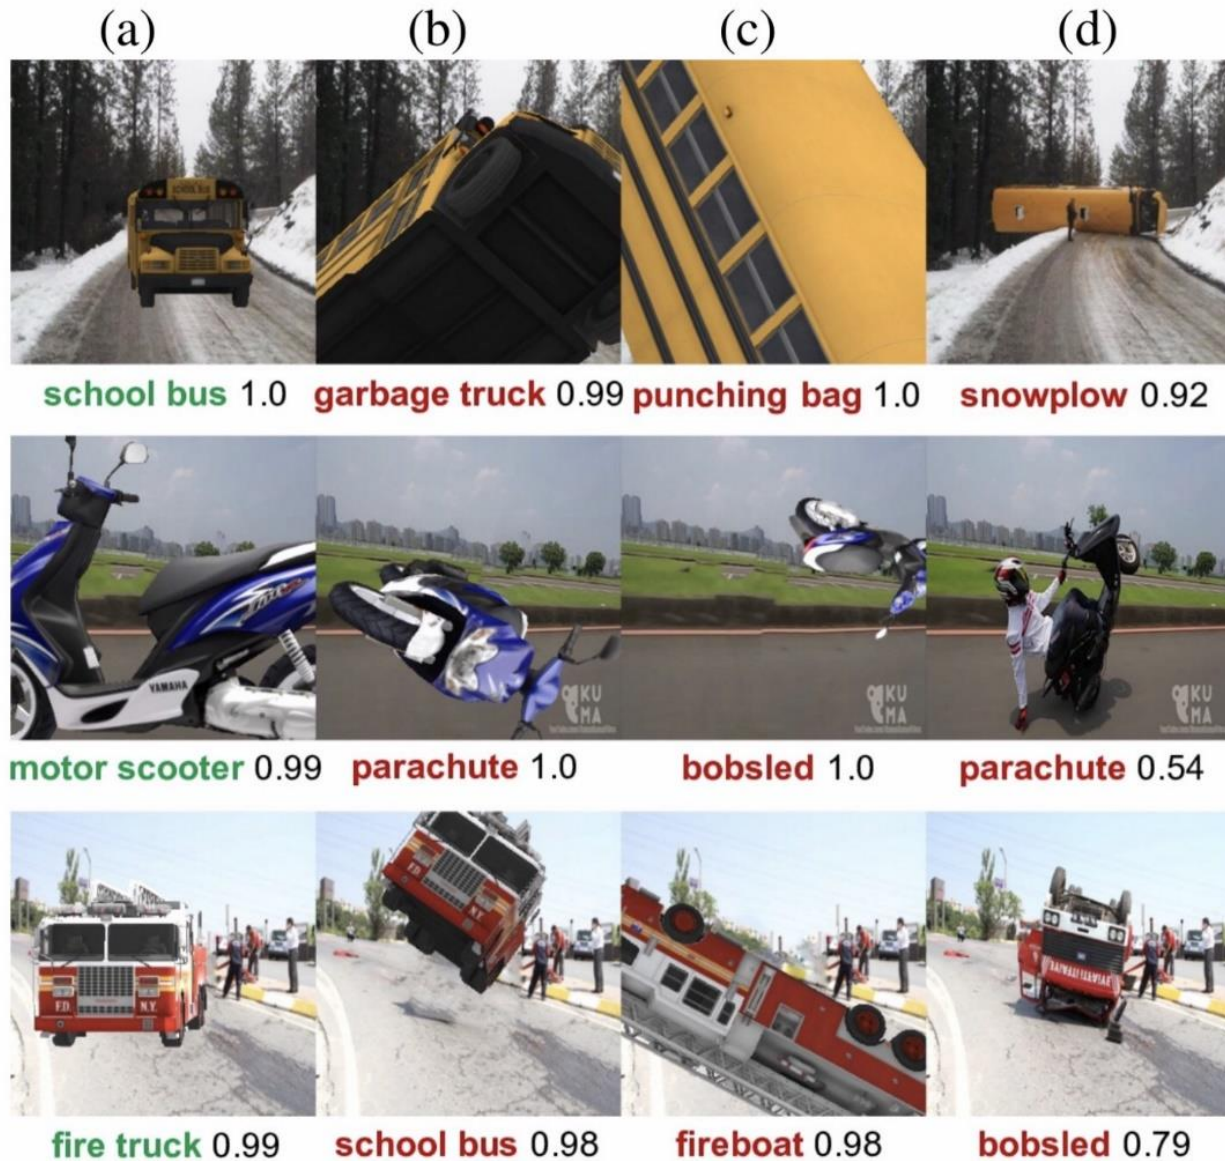

# Weaknesses of deep learning

# Failures on out-of-distribution examples

 Strike (with) a Pose: Neural Networks Are Easily Fooled by Strange Poses of Familiar Objects. arXiv:1811.11553

# Attacks on neural networks

place sticker on table

# What follows: more neural networks

- neural language models and word2vec representation
- convolutional neural networks
- recurrent neural networks for text and ELMo representation
- transformer networks and BERT representation
- middle level of language technologies (mostly based on neural nets): morphosyntactical analysis, dependency parsing, word sense disambiguation, semantic role labelling
- higher level of language technologies (mostly based on neural nets): machine translation, summarization, questions & answers, emotional computing
